Web Design Strategy

Name: Kauthar Abrahams

Student number: 251286835

Website goal

The goal is to introduce me as an emerging IT professional and present three examples of coursework I have contributed to. The portfolio highlights my beginner skills in networking, user-centred design and research. It gives visitors a quick way to learn about my background, review my projects and find the contact form.

Primary target audience

Primary audience: internship supervisors and potential employers. They need to understand my current level of study, identify relevant skills quickly, and see concise examples of what I have worked on. Clear project descriptions identify my contribution and the software used. The simple navigation helps visitors move between my background, portfolio and contact details without searching.

Content hierarchy and sitemap

Page	Content and Grouping
Home Index.html	Name and introduction first, followed by about me and my skills.
Portfolio Portfolio.html	Three project cards. Each includes an image with alternative text, title, summary of the project and software used.
Contact Contact.html	Short invitation, demonstration notice and labelled name, email and message fields with a submit button

Navigation: Every page uses the same visible menu linking Home/About, Portfolio and Contact. The content is grouped by visitor need: first learn who I am, then review evidence of my work, then use the contact form. The sitemap contains exactly three HTML pages.

Design choices

Colour: Blue is used for headings, links and buttons, with baby blue and white backgrounds. White cards separate content and help keep the page calm and consistent.

Typography: Poppins is used because it is familiar and easy to read on screens. Large headings establish hierarchy, while body text uses comfortable spacing and a readable line height.

Layout: Nav is used for navigation, and CSS Columns is used for content columns and project cards. A media query changes multi-column layouts to a single column on narrow screens. Images scale to their cards and include descriptive alternative text.

Usability: Navigation labels are consistent, form fields have visible labels, and keyboard focus is visible. The contact form is explicitly identified as a demonstration and does not send messages.
